Abstract. A spacelike surface in the Minkowski 3-space is called a constant slope surface if its position vector makes a constant angle with the normal at each point on the surface. These surfaces were completely classified in [J. Math. Anal. Appl., 385(2012), 208-220]. In this study, we give some relations between split quaternions and spacelike constant slope surfaces in Minkowski 3-space. We show that spacelike constant slope surfaces can be reparametrized by using rotation matrices corresponding to unit timelike quaternions with the spacelike vector parts and homothetic motions. Subsequently we give some examples to illustrate our main results.

1. Introduction

Quaternions were discovered by Sir William Rowan Hamilton as an extension to the complex numbers in 1843. The most important property of quaternions is that every unit quaternion represents a rotation and this plays a special role in the study of rotations in three-dimensional spaces. Also quaternions are an efficient way understanding many aspects of physics and kinematics. Many physical laws in classical, relativistic and quantum mechanics can be written nicely using them.

Today quaternions are used especially in the area of computer vision, computer graphics, animations, aerospace applications, flight simulators, navigation systems and to solve optimization problems involving the estimation of rigid body transformations.

Ozdemir and Ergin [9] showed that a unit timelike quaternion represents a rotation in Minkowski 3-space.

Keywords and phrases: spacelike constant slope surface, split quaternion, homothetic motion

(2010) Mathematics Subject Classification: 14Q10, 53A17, 53A35
Received: 29.06.2012. In revised form: 3.07.2012. Accepted: 27.07.2012.
Also they expressed Lorentzian rotation matrix generated with a timelike quaternion. Tosun et al. [10] investigated some properties of one-parameter homothetic motion in Minkowski 3-space. Furthermore, they expressed the relations between velocity and acceleration vectors of a point in moving space with respect to fixed and moving space.

Kula and Yayli [6] showed that the algebra of split quaternions $H^0$ has a scalar product that allows us to identify it with semi-Euclidean space $E^{4}_{2}$. They demonstrated that a pair $q$ and $p$ of unit split quaternions in $H^0$ determines a rotation $R_{qp} : H^0 \rightarrow H^0$. Moreover they proved that $R_{qp}$ is a product of rotations in a pair of orthogonal planes in $E^{4}_{2}$.

In the last few years, the study of the geometry of surfaces in 3-dimensional spaces, in particular of product type $M^2 \times \mathbb{R}$ was developed by a large number of mathematicians. For instance, constant angle surfaces:

A constant angle surface in $E^3$ is a surface whose tangent planes make a constant angle with a fixed vector field of ambient space. These surfaces are the generalizations of the concept of helix. These kinds of surfaces are models to describe some phenomena in physics of interfaces in liquid crystals and of layered fluids. Constant angle surfaces were studied in different ambient spaces, e.g. $S^2 \times \mathbb{R}$ and $H^2 \times \mathbb{R}$ [2, 3]. Moreover these surfaces were studied in Minkowski 3-space and classified in [7].

Another paper in this direction is [4], where Fu and Yang studied spacelike constant slope surfaces in Minkowski 3-space and classified these surfaces in the same space. They showed that $M \subset E^3_1$ is a spacelike constant slope surface lying in the timelike cone if and only if it can be parametrized by

$$x(u, v) = u \sinh \theta \left( \cosh \xi_1(u) f(v) + \sinh \xi_1(u) f'(v) \right),$$

where, $\theta$ is a positive constant angle function, $\xi_1(u) = \coth \theta \ln(u)$ and $f$ is a unit speed spacelike curve on $H^2$.

Also, $M \subset E^3_1$ is a spacelike constant slope surface lying in the spacelike cone if and only if it can be parametrized by

$$x(u, v) = u \cosh \theta \left( \cosh \xi_2(u) g(v) + \sinh \xi_2(u) g'(v) \right),$$

where, $\theta$ is a positive constant angle function, $\xi_2(u) = \tanh \theta \ln(u)$ and $g$ is a unit speed spacelike curve on $S^2_1$.

In our previous paper [1], we showed a new method to construct constant slope surfaces with quaternions in Euclidean 3-space. In light of recent studies, the purpose of this paper is to give some relations between split quaternions and spacelike constant slope surfaces in Minkowski 3-space. We will show that spacelike constant slope surfaces can be reparametrized by using rotation matrices corresponding to unit timelike quaternions with the spacelike vector parts and homothetic motions. Subsequently we will give some examples to illustrate our main results.

2. Basics Notations, Definitions and Formulas

In this section, we give some basic concepts and formulas on split quaternions and semi-Euclidean spaces. A split quaternion $p$ is an expression of
the form
\[ p = p_1 \mathbf{i} + p_2 \mathbf{j} + p_3 \mathbf{k}, \]
where \( p_1, p_2, p_3 \) and \( p_4 \) are real numbers and \( \mathbf{i}, \mathbf{j}, \mathbf{k} \) are split quaternion units which satisfy the non-commutative multiplication rules
\[ i^2 = -1, j^2 = k^2 = 1, i \times j = -j \times i = k, j \times k = -k \times j = -i, \]
and
\[ k \times i = -i \times k = j. \]

Let us denote the algebra of split quaternions by \( H' \) and its natural basis by \( \{1, i, j, k\} \). An element of \( H' \) is called a split quaternion. For a split quaternion \( p = p_1 \mathbf{i} + p_2 \mathbf{j} + p_3 \mathbf{k} + p_4 \mathbf{k} \), the conjugate \( \overline{p} \) of \( p \) is defined by
\[ \overline{p} = p_1 - p_2 \mathbf{i} - p_3 \mathbf{j} - p_4 \mathbf{k}. \]

Scalar and vector parts of a split quaternion \( p \) are denoted by \( S_p = p_1 \) and \( V_p = p_2 \mathbf{i} + p_3 \mathbf{j} + p_4 \mathbf{k} \), respectively. The split quaternion product of two quaternions \( p = (p_1, p_2, p_3, p_4) \) and \( q = (q_1, q_2, q_3, q_4) \) is defined as
\[ p \times q = p_1 q_1 + \langle V_p, V_q \rangle + p_1 V_q + q_1 V_p + V_p \wedge V_q, \]
where
\[ \langle V_p, V_q \rangle = -p_2 q_2 + p_3 q_3 + p_4 q_4. \]
If \( S_p = 0 \), then \( p \) is called as a pure split quaternion.

**Definition 2.1.** \( E^0 \) with the metric tensor
\[ \langle u, v \rangle = -\sum_{i=1}^{v} u_i v_i + \sum_{i=v+1}^{n} u_i v_i, \quad u, v \in \mathbb{R}^n, \quad 0 \leq v \leq n \]
is called semi-Euclidean space and denoted by \( E^v_0 \), where \( v \) is called the index of the metric. If \( v = 0 \), semi-Euclidean space \( E^0_0 \) is reduced to \( E^0 \). For \( n \geq 2 \), \( E^n_0 \) is called Minkowski \( n \)-space; if \( n = 4 \), it is the simplest example of a relativistic space time [8].

**Definition 2.2.** Let \( E^v_0 \) be a semi-Euclidean space furnished with a metric tensor \( \langle , \rangle \). A vector \( w \in E^v_0 \) is called
- spacelike if \( \langle w, w \rangle > 0 \) or \( w = 0 \),
- timelike if \( \langle w, w \rangle < 0 \),
- null if \( \langle w, w \rangle = 0 \) and \( w \neq 0 \). The norm of a vector \( w \in E^v_0 \) is \( \sqrt{\langle w, w \rangle} \).

Two vectors \( w_1 \) and \( w_2 \) in \( E^v_0 \) are said to be orthogonal if \( \langle w_1, w_2 \rangle = 0 \) [8].

We can define pseudo-sphere and pseudo-hyperbolic space as follows:
\[ S_0^{v-1} = \left\{ (v_1, \ldots, v_n) \in E_v^n \mid -\sum_{i=1}^{v} v_i^2 + \sum_{i=v+1}^{n} v_i^2 = 1 \right\}, \]
and
\[ H_0^{v-1} = \left\{ (v_1, \ldots, v_n) \in E_v^n \mid -\sum_{i=1}^{v} v_i^2 + \sum_{i=v+1}^{n} v_i^2 = -1 \right\}. \]
Also, for \( v = 1 \) and \( v_1 > 0 \), \( H^{n-1}_n = H^{n-1}_0 \) is called a hyperbolic space of \( E^{n-1}_1 \).

We can easily check that \(-p \times \overline{p} = -p_1^2 - p_2^2 + p_3^2 + p_4^2\). Therefore we identify \( H' \) with semi-Euclidean space \( E^4_2 \).

Let \( G = \{ p \in H' \mid p \times \overline{p} = 1 \} \) be the multiplicative group of timelike unit split quaternions. The Lie algebra \( g \) of \( G \) is the imaginary part of \( H_0' \), that is,

\[ g = \text{Im } H' = \{ p_2 i + p_3 j + p_4 k \mid p_2, p_3, p_4 \in \mathbb{R} \}. \]

The Lie bracket of \( g \) is simply the commutator of split quaternion product. Note that the commutation relation of \( g \) is given by

\[ [i, j] = 2k, \quad [j, k] = 2i, \quad [k, i] = 2j. \]

The Lie algebra \( g \) is naturally identified with \( E^3_1 \) as a metric linear space. Besides, the Lie group \( G \) is identified with \( H^3_1 \) of constant curvature \(-1\) (see [5]).

Thus we can define spacelike, timelike and lightlike quaternions as follows:

**Definition 2.3.** We say that a split quaternion \( p \) is spacelike, timelike or lightlike, if \( I_p < 0 \), \( I_p > 0 \) or \( I_p = 0 \), respectively, where \( I_p = p_1^2 + p_2^2 - p_3^2 - p_4^2 \) [9].

**Definition 2.4.** The norm of \( p = (p_1, p_2, p_3, p_4) \) is defined as

\[ N_p = \sqrt{p_1^2 + p_2^2 - p_3^2 - p_4^2}. \]

If \( N_p = 1 \), then \( p \) is called a unit split quaternion and \( p_0 = p/N_p \) is a unit split quaternion for \( N_p \neq 0 \). Also spacelike and timelike quaternions have multiplicative inverses having the property \( p \times p^{-1} = p^{-1} \times p = 1 \) and they are constructed by \( p^{-1} = \overline{p}/I_p \). Lightlike quaternions have no inverses [9].

The vector part of any spacelike quaternions is spacelike but the vector part of any timelike quaternion can be spacelike or timelike. Polar forms of the split quaternions are as below:

(i) Every spacelike quaternion can be written in the form

\[ p = N_p (\sinh \theta + \mathbf{v} \cosh \theta), \]

where \( \mathbf{v} \) is a unit spacelike vector in \( E^3'_1 \).

(ii) Every timelike quaternion with the spacelike vector part can be written in the form

\[ p = N_p (\cosh \theta + \mathbf{v} \sinh \theta), \]

where \( \mathbf{v} \) is a unit spacelike vector in \( E^3'_1 \).

(iii) Every timelike quaternion with the timelike vector part can be written in the form

\[ p = N_p (\cos \theta + \mathbf{v} \sin \theta), \]

where \( \mathbf{v} \) is a unit timelike vector in \( E^3'_1 \) [6, 9].

Unit timelike quaternions are used to perform rotations in the Minkowski 3-space: If \( p = (p_1, p_2, p_3, p_4) \) is a unit timelike quaternion, using the transformation law

\[ (p \times \mathbf{V} \times p^{-1})_i = \sum_{j=1}^{3} R_{ij} V_j, \]
the corresponding rotation matrix can be found as

\[
R_p = \begin{bmatrix}
    p_1^2 + p_2^2 + p_3^2 + p_4^2 & 2p_1p_4 - 2p_2p_3 & -2p_1p_3 - 2p_2p_1 \\
    2p_2p_3 + 2p_4p_1 & p_1^2 - p_2^2 - p_3^2 + p_4^2 & -2p_3p_4 - 2p_2p_1 \\
    2p_2p_1 - 2p_3p_4 & p_1^2 - p_2^2 + p_3^2 - p_4^2 & p_1^2 - p_2^2 - p_3^2 - p_4^2
\end{bmatrix},
\]

where \( V \) is a pure split quaternion. This is possible with unit timelike quaternions. Also causal character of vector part of the unit timelike quaternion \( p \) is important. If the vector part of \( p \) is timelike or spacelike then the rotation angle is spherical or hyperbolic, respectively [9].

In Minkowski 3-space, one-parameter homothetic motion of a body is generated by the transformation

\[
\begin{bmatrix}
    Y \\
    1
\end{bmatrix} = \begin{bmatrix}
    hA & C \\
    0 & 1
\end{bmatrix} \begin{bmatrix}
    X \\
    1
\end{bmatrix},
\]

where \( X \) and \( C \) are real matrices of 3 \( \times \) 1 type and \( h \) is a homothetic scale and \( A \in SO(3) \). \( A, h \) and \( C \) are differentiable functions of \( C^\infty \) class of a parameter \( t \) [10].

3. Split Quaternions and Spacelike Constant Slope Surfaces Lying in the Timelike Cone

In this section, we study unit timelike quaternions with the spacelike vector parts and spacelike constant slope surfaces lying in the timelike cone. Firstly, we obtain the following equation for later use.

A unit timelike quaternion with the spacelike vector part

\[
Q(u, v) = \cosh(\xi_1(u)/2) - \sinh(\xi_1(u)/2)f'(v)
\]

defines a 2-dimensional surface on \( H^1 \), where \( \xi_1(u) = \coth \theta \ln u, \theta \) is a positive constant angle function, \( f' = (f'_1, f'_2, f'_3) \) and \( f \) is a unit speed spacelike curve on \( H^2 \). Thus, using the transformation law

\[
(Q \times V \times Q^{-1})_i = \sum_{j=1}^{3} R_{ij} V_j,
\]

the corresponding rotation matrix can be found as

\[
R_Q = \begin{bmatrix}
    \cosh^2 \frac{\xi_1}{2} + \sinh^2 \frac{\xi_1}{2}(f'_1^2 + f'_2^2 + f'_3^2) & -2\sinh \frac{\xi_1}{2} f'_1 f'_2 - \sinh \xi_1 f'_3 \\
    2\sinh^2 \frac{\xi_1}{2} f'_1 f'_2 - \sinh \xi_1 f'_3 & \cosh^2 \frac{\xi_1}{2} + \sinh^2 \frac{\xi_1}{2}(-f'_1^2 - f'_2^2 + f'_3^2) \\
    2\sinh^2 \frac{\xi_1}{2} f'_1 f'_3 + \sinh \xi_1 f'_2 & -2\sinh \frac{\xi_1}{2} f'_2 f'_3 - \sinh \xi_1 f'_1
\end{bmatrix}
\]

(5)

We now give the relation between unit timelike quaternions with the spacelike vector parts and spacelike constant slope surfaces lying in the timelike cone.
**Theorem 3.1.** Let \( x : M \rightarrow E_3^1 \) be a spacelike surface immersed in Minkowski 3-space \( E_3^1 \) and \( x \) lies in the timelike cone. Then the constant slope surface \( M \) can be reparametrized by

\[
x(u, v) = Q_1(u, v) \times Q_2(u, v),
\]

where \( Q_1(u, v) = \cosh \xi_1(u) - \sinh \xi_1(u)f'(v) \) is a unit timelike quaternion with the spacelike vector part, \( Q_2(u, v) = u \sinh \theta f(v) \) is a surface and a pure split quaternion in \( E_3^1 \) and \( f \) is a unit speed spacelike curve on \( H^2 \).

**Proof** Since \( Q_1(u, v) = \cosh \xi_1(u) - \sinh \xi_1(u)f'(v) \) and \( Q_2(u, v) = u \sinh \theta f(v) \), we obtain

\[
Q_1(u, v) \times Q_2(u, v) = (\cosh \xi_1(u) - \sinh \xi_1(u)f'(v)) \times (u \sinh \theta f(v))
\]

(6)

\[
= u \sinh \theta (\cosh \xi_1(u) - \sinh \xi_1(u)f'(v)) \times f(v)
\]

\[
= u \sinh \theta (\cosh \xi_1(u)f(v) - \sinh \xi_1(u)f'(v) \times f(v))
\]

Using Eq. (3), we have

\[
f' \times f = (f', f) + f' \wedge f.
\]

Since \( f \) is a unit speed spacelike curve on \( H^2 \), we have

(7)

\[-f' \times f = f \wedge f'.\]

If we substitute Eq. (7) into Eq. (6), we get

\[
Q_1(u, v) \times Q_2(u, v) = u \sinh \theta \left( \cosh \xi_1(u)f(v) + \sinh \xi_1(u)f(v) \wedge f'(v) \right).
\]

Therefore applying Eq. (1), we conclude

\[
Q_1(u, v) \times Q_2(u, v) = x(u, v).
\]

This completes the proof.

From Theorem 3.1, we can see that the spacelike constant slope surface \( M \) lying in the timelike cone is the split quaternion product of 2-dimensional surfaces \( Q_1(u, v) \) on \( H^2 \) and \( Q_2(u, v) \) in \( E_3^1 \).

Let us consider the relations among rotation matrices \( R_Q \), homothetic motions and spacelike constant slope surfaces lying in the timelike cone. We have the following results of Theorem 3.1.

**Corollary 3.2.** Let \( R_Q \) be the rotation matrix corresponding to the unit timelike quaternion with the spacelike vector part \( Q(u, v) \). Then the spacelike constant slope surface \( M \) can be written as

\[
x(u, v) = R_Q Q_2(u, v).
\]

**Corollary 3.3.** For the homothetic motion \( \tilde{Q}(u, v) = u \sinh \theta Q_1(u, v) \), the constant slope surface \( M \) can be reparametrized by \( x(u, v) = \tilde{Q}(u, v) \times f(v) \). Therefore, we have

(8)

\[
x(u, v) = u \sinh \theta R_Q f(v).
\]

We can give the following remarks regarding Theorem 3.1 and Corollary 3.3.
Split quaternions and spacelike constant slope surfaces in Minkowski 3-space

Remark 3.4. Theorem 3.1 says that both the points and the position vectors on the surface $Q_2(u, v)$ are rotated by $Q_1(u, v)$ through the hyperbolic angle $\xi_1(u)$ about the spacelike axis $S_p\{f'(v)\}$.

Remark 3.5. Corollary 3.3 says that the position vector of the curve $f(v)$ is rotated by $Q(u, v)$ through the hyperbolic angle $\xi_1(u)$ about the spacelike axis $S_p\{f'(v)\}$ and extended through the homothetic scale $u \sinh \theta$.

4. Split Quaternions and Spacelike Constant Slope Surfaces Lying in the Spacelike Cone

In this section, as in Section 3, we study unit timelike quaternions with the spacelike vector parts and spacelike constant slope surfaces lying in the spacelike cone. Similarly, we obtain the following equation for later use.

A unit timelike quaternion with the spacelike vector part

$$Q(u, v) = \cosh(\xi_2(u)/2) - \sinh(\xi_2(u)/2)g'(v)$$

defines a 2-dimensional surface on $\mathbb{H}^3_1$, where $\xi_2(u) = \tanh \theta \ln u$, $\theta$ is a positive constant angle function, $g' = (g'_1, g'_2, g'_3)$ and $g$ is a unit speed spacelike curve on $S^2_1$. Thus, using the transformation law

$$(Q \times V \times Q^{-1})_i = \sum_{j=1}^3 R_{ij} V_j,$$

the corresponding rotation matrix can be found as

$$R_Q = \begin{bmatrix}
\cosh^2 \frac{\xi_2}{2} + \sinh^2 \frac{\xi_2}{2}(g''_1 + g''_2 + g''_3) & -2 \sinh \frac{\xi_2}{2} g''_1 g'_3 - \sinh \xi_2 g'_3 \\
2 \sinh^2 \frac{\xi_2}{2} g'_1 g'_2 - \sinh \xi_2 g'_3 & \cosh^2 \frac{\xi_2}{2} + \sinh^2 \frac{\xi_2}{2}(-g''_1 - g''_2 + g''_3) \\
2 \sinh^2 \frac{\xi_2}{2} g'_1 g'_3 + \sinh \xi_2 g'_2 & -2 \sinh^2 \frac{\xi_2}{2} g'_2 g'_3 - \sinh \xi_2 g'_1 \\
& \cosh^2 \frac{\xi_2}{2} + \sinh^2 \frac{\xi_2}{2}(-g''_1 + g''_2 - g''_3)
\end{bmatrix}.$$  \hspace{1cm} (9)

We now give the relation between unit timelike quaternions with the spacelike vector parts and spacelike constant slope surfaces lying in the spacelike cone.

Theorem 4.1. Let $x : M \to E^3_1$ be a spacelike surface immersed in Minkowski 3-space $E^3_1$ and $x$ lies in the spacelike cone. Then the constant slope surface $M$ can be reparametrized by

$$x(u, v) = Q_1(u, v) \times Q_2(u, v),$$

where $Q_1(u, v) = \cosh \xi_2(u) - \sinh \xi_2(u)g'(v)$ is a unit timelike quaternion with the spacelike vector part, $Q_2(u, v) = u \cosh \theta g(v)$ is a surface and a pure split quaternion in $E^3_1$ and $g$ is a unit speed spacelike curve on $S^2_1$. 
Proof Since $Q_1(u, v) = \cosh \xi_2(u) - \sinh \xi_2(u)g'(v)$ and $Q_2(u, v) = u \cosh \theta g(v)$, we obtain

$$Q_1(u, v) \times Q_2(u, v) = \left( \cosh \xi_2(u) - \sinh \xi_2(u)g'(v) \right) \times \left( u \cosh \theta g(v) \right)$$

(10)

$$= u \cosh \theta \left( \cosh \xi_2(u) - \sinh \xi_2(u)g'(v) \right) \times g(v)$$

By using Eq. (3), we have

$$g' \times g = \langle g', g \rangle + g' \wedge g.$$  

Since $g$ is a unit speed spacelike curve on $S^2_1$, we have

$$-g' \times g = g \wedge g'.$$

Substituting Eq. (11) into Eq. (10) gives

$$Q_1(u, v) \times Q_2(u, v) = u \cosh \theta \left( \cosh \xi_2(u)g(v) + \sinh \xi_2(u)g(v) \wedge g'(v) \right).$$

Therefore applying Eq. (2), we conclude

$$Q_1(u, v) \times Q_2(u, v) = x(u, v).$$

This completes the proof.

Similarly, from Theorem 4.1, we can see that the spacelike constant slope surface $M$ lying in the spacelike cone is the split quaternion product of 2-dimensional surfaces $Q_1(u, v)$ on $H^3_1$ and $Q_2(u, v)$ in $E^3_1$.

Let us consider the relations among rotation matrices $R_Q$, homothetic motions and spacelike constant slope surfaces lying in the spacelike cone. We have the following results of Theorem 4.1.

Corollary 4.2. Let $R_Q$ be the rotation matrix corresponding to the unit timelike quaternion with the spacelike vector part $Q(u, v)$. Then the spacelike constant slope surface $M$ can be written as

$$x(u, v) = R_QQ_2(u, v).$$

Corollary 4.3. For the homothetic motion $\tilde{Q}(u, v) = u \cosh \theta Q_1(u, v)$, the constant slope surface $M$ can be reparametrized by $x(u, v) = \tilde{Q}(u, v) \times g(v)$. Therefore, we have

$$x(u, v) = u \cosh \theta R_Qg(v).$$

(12)

We can give the following remarks regarding Theorem 4.1 and Corollary 4.3.

Remark 4.4. Theorem 4.1 says that both the points and the position vectors on the surface $Q_2(u, v)$ are rotated by $Q_1(u, v)$ through the hyperbolic angle $\xi_2(u)$ about the spacelike axis $S_{p}\{g'(v)\}$.

Remark 4.5. Corollary 4.3 says that the position vector of the curve $g(v)$ is rotated by $\tilde{Q}(u, v)$ through the hyperbolic angle $\xi_2(u)$ about the spacelike axis $S_{p}\{g'(v)\}$ and extended through the homothetic scale $u \cosh \theta$. 
5. Examples and Their Pictures

We now give some examples of spacelike constant slope surfaces and draw their pictures by using Mathematica computer program.

Example 5.1. Let us consider a unit spacelike curve on $H^2$ defined by
$$f(v) = (\cosh v, 0, \sinh v).$$

Taking $\theta = 7$ and $\coth 7 \cong 1$, the homothetic motion is equal to
$$\tilde{Q}(u, v) = u \sinh 7 \left( \cosh(\ln u) + (\sinh(\ln u) \sinh v, 0, -\sinh(\ln u) \cosh v) \right).$$

By using Eq. (8), we have the following spacelike constant slope surface lying in the timelike cone:
$$x(u, v) = u \sinh 7 \begin{bmatrix} \cosh^2 \left( \frac{\ln u}{2} \right) + \sinh^2 \left( \frac{\ln u}{2} \right) \cosh 2v & -\sinh(\ln u) \cosh v \\ -\sinh(\ln u) \cosh v & \cosh(\ln u) \end{bmatrix} \begin{bmatrix} \cosh v \\ 0 \end{bmatrix}.$$

and then
$$x(u, v) = \begin{bmatrix} u \sinh 7 \cosh(\ln u) \cosh v \\ -u \sinh 7 \sinh(\ln u) \\ u \sinh 7 \cosh(\ln u) \sinh v \end{bmatrix}.$$

Hence, we can draw the picture of $x(u, v) = u \sinh \theta R_Q f(v)$ as follows:

Figure 1: Spacelike constant slope surface lying in the timelike cone $x(u, v) = u \sinh \theta R_Q f(v)$, $f(v) = (\cosh v, 0, \sinh v)$, $\theta = 7$. 
Example 5.2. Let us consider a unit spacelike curve on $S^2_1$ defined by
$$g(v) = (0, \cos v, \sin v).$$
Taking $\theta = 7$ and $\tanh 7 \approx 1$, the homothetic motion is equal to
$$\tilde{Q}(u, v) = u \cosh 7 \left( \cosh(\ln u) + (0, \sinh(\ln u) \sin v, -\sinh(\ln u) \cos v) \right).$$
By using Eq. (12), we have the following spacelike constant slope surface lying in the spacelike cone:
$$x(u, v) = u \cosh 7 \begin{bmatrix}
\cosh(\ln u) & -\sinh(\ln u) \cos v \\
-\sinh(\ln u) \cos v & \cosh^2 \left( \frac{\ln u}{2} \right) + \sinh^2 \left( \frac{\ln u}{2} \right) \cos 2v \\
-\sinh(\ln u) \sin v & \sinh^2 \left( \frac{\ln u}{2} \right) \sin 2v \\
-\sinh(\ln u) \sin v & \sinh^2 \left( \frac{\ln u}{2} \right) \sin 2v \\
\cosh^2 \left( \frac{\ln u}{2} \right) - \sinh^2 \left( \frac{\ln u}{2} \right) \cos 2v & 0 \\
\sinh(\ln u) \sin v & \sin v
\end{bmatrix},$$
and then
$$x(u, v) = \begin{bmatrix}
-u \cosh 7 \sinh(\ln u) \\
u \cosh 7 \cosh(\ln u) \cos v \\
u \cosh 7 \cosh(\ln u) \sin v
\end{bmatrix}.$$ 
Hence, we can draw the picture of $x(u, v) = u \cosh \theta R_Q g(v)$ as follows:

Figure 2: Spacelike constant slope surface lying in the spacelike cone $x(u, v) = u \cosh \theta R_Q g(v)$, $g(v) = (0, \cos v, \sin v)$, $\theta = 7$. 

Split quaternions and spacelike constant slope surfaces in Minkowski 3-space
